

NetSpective and Safe Search

NetSpective has the ability to enforce safe search for the following search engines: Google, Bing, MSN, Yahoo, Hotbot, Lycos, Ask, and Dogpile.

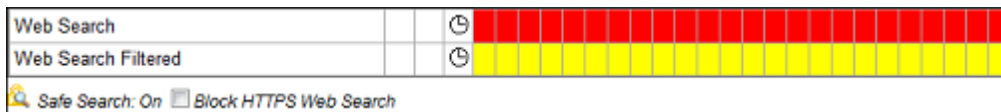

1. Navigate to the Group Policy page and observe the settings

From the Group Policy screen, at the bottom of the category list we see the Web Search and Web Search Filtered categories, as well as the Safe Search option. Currently Web Search and Web Search Filtered are in Log mode and Safe Search is off.

2. Enable Safe Search and observe the effect

Click on the Safe Search padlock icon to enable Safe Search. When Safe Search is enabled, Web Search is changed to a blocked mode and Web Search Filtered is changed to Log mode.

3. Using the Save To feature

By clicking on the Save To button we open up the Save To window. In the categories pane, if we check Web Search and Web Search Filtered, we can then apply these settings to any of the groups we select in the Groups pane on the right.
