

# NetSpective Example Configuration

The NetSpective Evaluation Appliance has been preconfigured with an Example Configuration. Some of our most important features have been pre-enabled to ensure that the filtering is as effective as it can be right out of the box. This Example Configuration can easily be altered to become the configuration for your network.

The Example Configuration is outlined below:

**Updates:** Micro Updates are set to every 10 minutes. Unknown websites such as Anonymous Proxies will be communicated back to TeleMate.Net and category updates for those unknown sites will be sent back to all appliances in distribution on a 10 minute interval.

**Managers:** Three example managers have been created.

- **Librarian** was given Mobile Device Manager. If your school is issuing out iPads like books in a library scenario, these privileges would be useful for a librarian.
- **Principal** was given Group Manager with some limited access. They cannot create/delete users and certain categories have been redacted from the Group Policy section such as Anonymous Proxies, Pornography, and a couple of others.
- **Teacher** was given Block Page Override Manager. The ability to override block pages during class would be useful for a teacher.

## Groups:

- **Staff** were given an alternate days policy so they're less restricted on the weekends when school isn't in session. Block Overrides are set to Group Override, 30 minutes of access, and email notifications are set to 20. Abuse Settings, Policy Reminder was enabled for every 1440 minutes (one day).
- **Students** were given Individual Overrides with 15 minutes of access. Abuse Settings, Policy Reminder was enabled for every 1440 minutes (one day).
- **Teachers** were given an alternate days policy so they're less restricted on the weekends when school isn't in session. Block Overrides are set to Group Override, 30 minutes of access, and email notifications are set to 20. Abuse Settings, Policy Reminder was enabled for every 1440 minutes (one day).

**Group Policy:** Please note that the Public Policy is the only policy that will affect your network when the appliance is first installed in your network. Group settings such as Teachers and Students are merely examples that do not contain any user information and therefore will not be applied to your network users. Controversial categories such as *Remote Login Protocols*, *Streaming Media*, *Society*, and *Voice Over IP* have not been set to Block and will be logged only.

- **Public** is set to block only the most obvious categories you would want blocked. Things you'll probably be blocking already, or won't mind if you're blocking. *Anonymous Proxy & Hacking*,

*Browser Protection, Lingerie, Mature Content, Nudism and Naturism, P2P, Pornography, Sexual Advice, Sexual Orientation, Violence, and Safe Search(is enabled).*

- **Staff and Teachers** are basically the same policy as Public, with a couple categories set only to logging on the weekends such as *Mature Content*.
- **Students** are a bit more locked down with categories that are likely to be inappropriate during class.

**Overrides:** There are two example Domain Overrides for *KahnAcademy.org* = *Education*, *telemate.net* = *Admin Allow*.

- **Search Terms** have been added under the System group. *Pornography* and *Anonymous Proxy* have been added and put them under their respective categories. If you are blocking those categories in the Group Policy section then those search terms will also be blocked.
- A *Streaming Media* list was added to the **File Extensions** section, under the System Group, and categorized appropriately.

**Device Settings > Logging:** Syslog and NetAuditor Link have been enabled and set up. IP addresses for each were set to 0.0.0.0

**Filter Settings > Advanced:** Browser Protection has been enabled, putting the Malware and Phishing sub categories into the Group Policy section.
